

Random Restrictions on Boolean Functions with Small Influences

Ronen Eldan, Avi Wigderson, *Pei Wu*

Oct., 2022

Some background

Influences

$$f \colon \{0,1\}^n \rightarrow \{0,1\}.$$

Influences

$$f: \{0,1\}^n \rightarrow \{0,1\}.$$

Definition (influence and max influence)

$$\text{Inf}_i[f] = \Pr_x [f(x) \neq f(x \oplus e_i)],$$

$$\text{MaxInf}[f] = \max_{i \in [n]} \text{Inf}_i(f).$$

Examples

$$\text{|. MAJ}_n : x \mapsto \mathbf{I}_{\{|x| > n/2\}}.$$

Examples

|. $\text{MAJ}_n : x \mapsto \mathbf{I}_{\{|x|>n/2\}} \cdot$

Fact. $\text{MaxInf}(\text{MAJ}_n) = \Theta\left(\frac{1}{\sqrt{n}}\right).$

Examples

$$\text{|.MAJ}_n : x \mapsto \mathbf{I}_{\{|x|>n/2\}} .$$

Fact. $\text{MaxInf}(\text{MAJ}_n) = \Theta\left(\frac{1}{\sqrt{n}}\right).$

Proof:

$$\text{Inf}_i(f) = \Pr \left[\left| |x| - \frac{n}{2} \right| \leq 1 \right] \cdot \Theta(1) .$$

Examples

|. $\text{MAJ}_n : x \mapsto \mathbf{I}_{\{|x|>n/2\}}$.

Fact. $\text{MaxInf}(\text{MAJ}_n) = \Theta\left(\frac{1}{\sqrt{n}}\right)$.

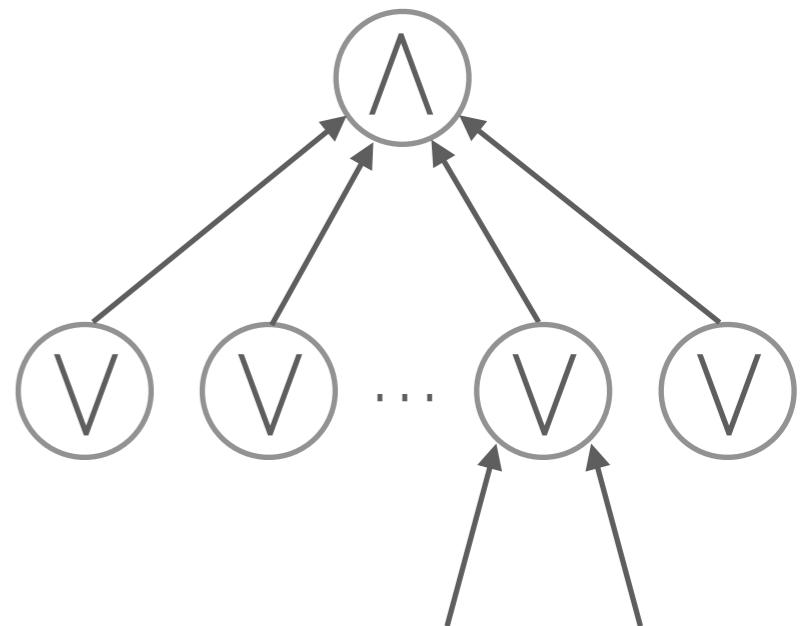

Proof:

$$\text{Inf}_i(f) = \Pr \left[\left| |x| - \frac{n}{2} \right| \leq 1 \right] \cdot \Theta(1).$$

e.g. 01010101010, any 0 is sensitive

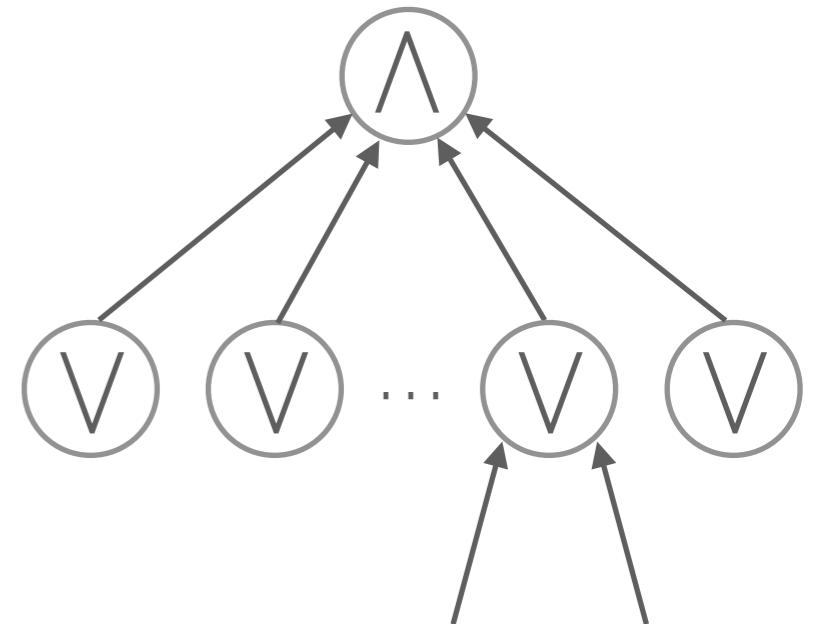

Examples

2. TRIBES_n(x) = $\bigwedge_{i=1}^s \bigvee_{j=1}^w (x_{i,j}),$
 $s = n/w, w \approx \log n - \log \log n.$

Examples

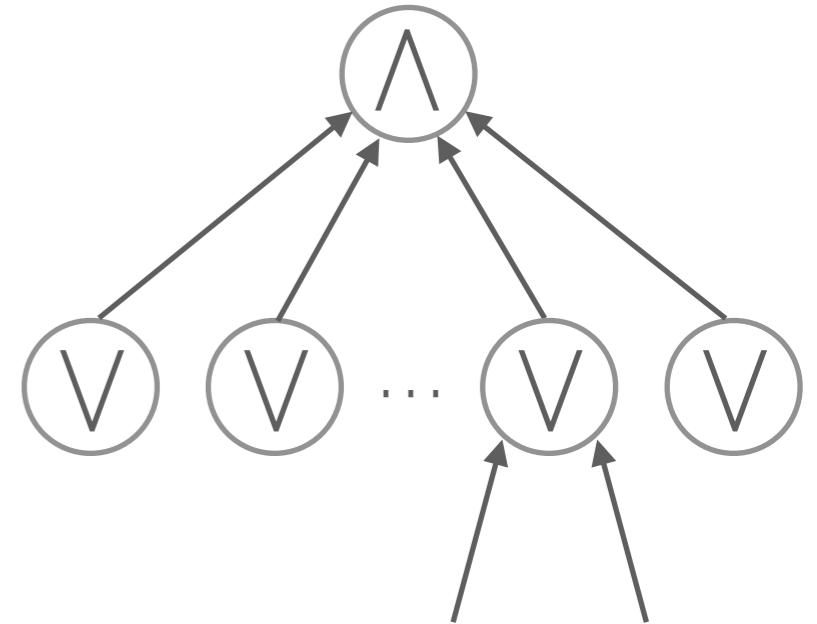

2. TRIBES_n(x) = $\bigwedge_{i=1}^s \bigvee_{j=1}^w (x_{i,j}),$
 $s = n/w, w \approx \log n - \log \log n.$

Fact. MaxInf(TRIBES_n) = $\Theta\left(\frac{\log n}{n}\right).$

Examples

$$2. \text{TRIBES}_n(x) = \bigwedge_{i=1}^s \bigvee_{j=1}^w (x_{i,j}),$$
$$s = n/w, w \approx \log n - \log \log n.$$

Fact. $\text{MaxInf}(\text{TRIBES}_n) = \Theta\left(\frac{\log n}{n}\right).$

Proof sketch:

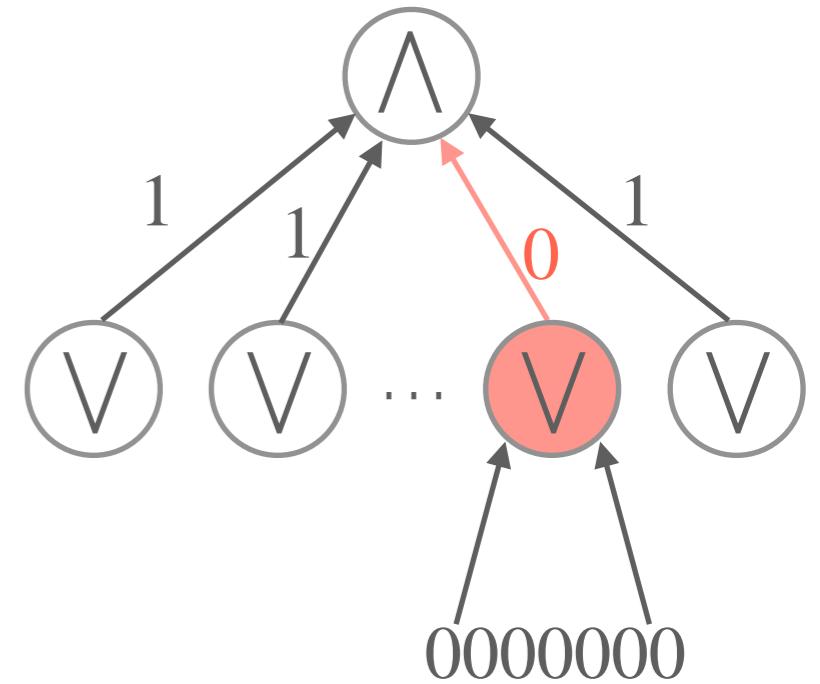

Suffices to check the case when

$$\text{TRIBES}(x) = 0.$$

With $\Theta(1)$ probability, exactly
one OR gate evaluates to 0.

Examples

$$2. \text{TRIBES}_n(x) = \bigwedge_{i=1}^s \bigvee_{j=1}^w (x_{i,j}),$$
$$s = n/w, w \approx \log n - \log \log n.$$

Fact. $\text{MaxInf}(\text{TRIBES}_n) = \Theta\left(\frac{\log n}{n}\right).$

Proof sketch:

Suffices to check the case when

$$\text{TRIBES}(x) = 0.$$

With $\Theta(1)$ probability, exactly
one OR gate evaluates to 0.

Functions with small influences

Assume: $\text{MaxInf}[f] = o(1)$, $\text{Var}[f] = \Omega(1)$.

Functions with small influences

Assume: $\text{MaxInf}[f] = o(1)$, $\text{Var}[f] = \Omega(1)$.

Some motivations:

- I. Social choice theory

Functions with small influences

Assume: $\text{MaxInf}[f] = o(1)$, $\text{Var}[f] = \Omega(1)$.

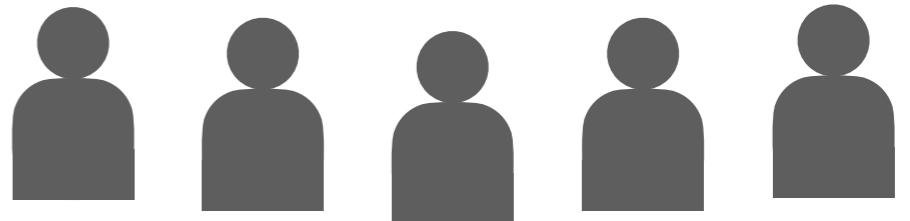

Some motivations:

1. Social choice theory
2. PCP/Hardness of approximation

Functions with small influences

Assume: $\text{MaxInf}[f] = o(1)$, $\text{Var}[f] = \Omega(1)$.

Some motivations:

1. Social choice theory
2. PCP/Hardness of approximation
3. Invariance principle

$$\sum X_i \approx \text{Gaussian}$$

Random restrictions

$$f: \{0,1\}^n \rightarrow \{0,1\}.$$

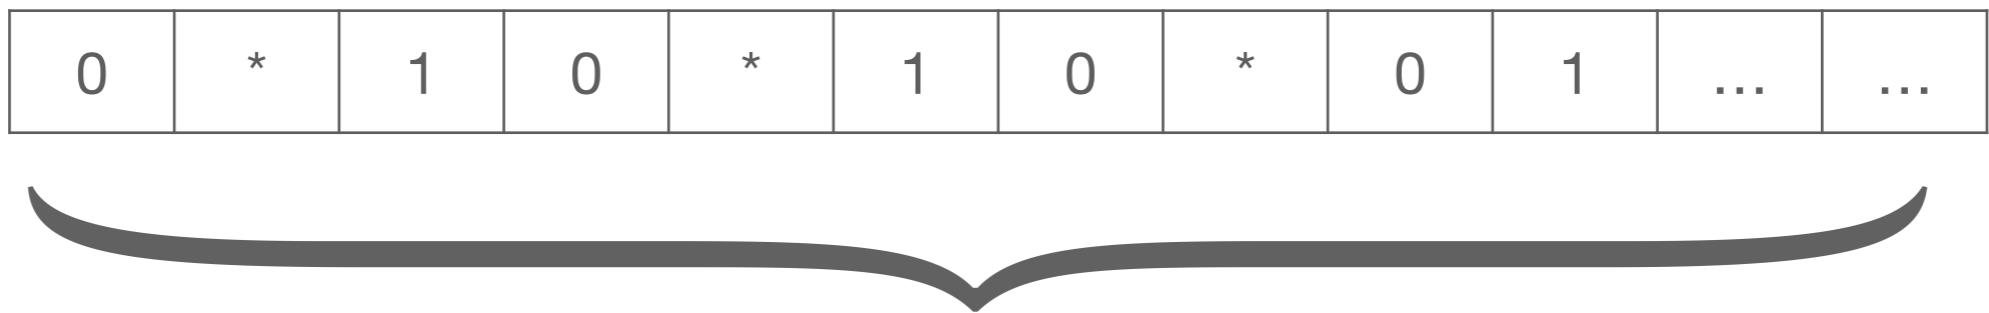

Random restrictions

$f: \{0,1\}^n \rightarrow \{0,1\}.$

0	*	1	0	*	1	0	*	0	1
---	---	---	---	---	---	---	---	---	---	-----	-----

Random restrictions

$f: \{0,1\}^n \rightarrow \{0,1\}.$

p -random restriction $f|_{R_p}$: fix p random bits

Our results

Theorem (Eldan, Wigderson, W.)

For any $f: \{0,1\}^n \rightarrow \{0,1\}$, with $\text{MaxInf}(f) = \tau = o(1)$,
 $\Omega(1)$ variance. Then for alive probability

$$\rho = \tilde{\Omega}\left(\frac{1}{\log 1/\tau}\right), \text{ we have}$$

$$\Pr[f|_{R_{1-\rho}} \text{ is nonconstant}] = 1 - o(1).$$

Our results

Theorem (Eldan, Wigderson, W.)

For any $f: \{0,1\}^n \rightarrow \{0,1\}$, with $\text{MaxInf}(f) = \tau = o(1)$, $\Omega(1)$ variance. Then for alive probability

$$\rho = \tilde{\Omega}\left(\frac{1}{\log 1/\tau}\right), \text{ we have}$$

$$\Pr[f|_{R_{1-\rho}} \text{ is nonconstant}] = 1 - o(1).$$

Remarks:

- I. *Optimality* (w.r.t. ρ): the Tribes function.

Our results

Theorem (Eldan, Wigderson, W.)

For any $f: \{0,1\}^n \rightarrow \{0,1\}$, with $\text{MaxInf}(f) = \tau = o(1)$, $\Omega(1)$ variance. Then for alive probability

$$\rho = \tilde{\Omega}\left(\frac{1}{\log 1/\tau}\right), \text{ we have}$$

$$\Pr[f|_{R_{1-\rho}} \text{ is nonconstant}] = 1 - o(1).$$

Remarks:

I. Optimality (w.r.t. ρ): the Tribes function.

Proof. by Hastad's Switching Lemma

Our results

Theorem (Eldan, Wigderson, W.)

For any $f: \{0,1\}^n \rightarrow \{0,1\}$, with $\text{MaxInf}(f) = \tau = o(1)$, $\Omega(1)$ variance. Then for alive probability

$$\rho = \tilde{\Omega}\left(\frac{1}{\log 1/\tau}\right), \text{ we have}$$

$$\Pr[f|_{R_{1-\rho}} \text{ is nonconstant}] = 1 - o(1).$$

$$\Pr[\text{Var}[f]_R \leq p^{\tilde{\Theta}(1/\rho)}] \leq p$$

Remarks:

1. Optimality (w.r.t. ρ): the Tribes function.

Our results

Theorem (Eldan, Wigderson, W.)

For any $f: \{0,1\}^n \rightarrow \{0,1\}$, with $\text{MaxInf}(f) = \tau = o(1)$,
 $\Omega(1)$ variance. Then for alive probability

$$\rho = \tilde{\Omega}\left(\frac{1}{\log 1/\tau}\right), \text{ we have}$$

$$\Pr[f|_{R_{1-\rho}} \text{ is nonconstant}] = 1 - o(1).$$

$$\Pr[\text{Var}[f]_R \leq p^{\tilde{\Theta}(1/\rho)}] \leq p$$

Remarks:

1. Optimality (w.r.t. ρ): the Tribes function.
2. Optimality (w.r.t. Var): the Majority function.

Our results

Theorem (Eldan, Wigderson, W.)

For any $f: \{0,1\}^n \rightarrow \{0,1\}$, with $\text{MaxInf}(f) = \tau = o(1)$, $\Omega(1)$ variance. Then for alive probability

$$\rho = \tilde{\Omega}\left(\frac{1}{\log 1/\tau}\right), \text{ we have}$$

$$\Pr[f|_{R_{1-\rho}} \text{ is nonconstant}] = 1 - o(1).$$

Remarks (more):

- “It ain’t over till it’s over” conjecture! — Friedgut-Kalai ’06

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

Sensitivity $s_f(x)$: number of sensitive bits

$$s_f(x) := |\{i : f(x) \neq f(x \oplus e_i)\}|.$$

Block sensitivity $\text{bs}_f(x)$: max number of disjoint sensitive blocks

$$\begin{aligned} \text{bs}_f(x) := \max & |\{ \text{disjoint } S_1, S_2, \dots, S_k \subseteq [n] \\ & : f(x) \neq f(x \oplus 1_{S_i})\}|. \end{aligned}$$

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

No such result holds for sensitivity.

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

No such result holds for sensitivity.

Remark: By KKL inequality,

$$\mathbf{E}[\text{bs}_f(x)] \geq \mathbf{E}[\text{s}_f(x)] \geq \Omega(\log(1/\tau)).$$

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

Proof sketch.

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

Proof sketch.

Random input x

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

Proof sketch.

Partition $[n]$ into $M = \tilde{O}(\log(1/\tau))$ random blocks,

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

Proof sketch.

Partition $[n]$ into $M = \tilde{O}(\log(1/\tau))$ random blocks,

One application

Corollary.

For any balanced function f , with $\tau = o(1)$ max influence, then

$$\Pr[\text{bs}_f(x) \geq \tilde{\Omega}(\log(1/\tau))] = 1 - o(1).$$

Proof sketch.

Partition $[n]$ into $M = \tilde{O}(\log(1/\tau))$ random blocks,
Any $M - 1$ blocks, induces a random restriction.

Proof of the main result

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

$$f = 1 + x_1 + x_2 + x_1 x_2$$

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

$$f = 1 + x_1 + x_2 + x_1 x_2$$

Uniform process

1. Random permutation π ,
2. $X(0) = 0^n$,
3. $X_i(t) = X_i(t - 1)$, for $i \neq \pi(t)$;
 $X_{\pi(t)}(t) \sim \{-1,1\}$, for $t = 1, 2, \dots, n$

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

$$f = 1 + x_1 + x_2 + x_1 x_2$$

Uniform process

1. Random permutation π ,
2. $X(0) = 0^n$,
3. $X_i(t) = X_i(t - 1)$, for $i \neq \pi(t)$;
 $X_{\pi(t)}(t) \sim \{-1,1\}$, for $t = 1, 2, \dots, n$

$$X(0) = 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ \dots$$

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

$$f = 1 + x_1 + x_2 + x_1 x_2$$

Uniform process

1. Random permutation π ,
2. $X(0) = 0^n$,
3. $X_i(t) = X_i(t - 1)$, for $i \neq \pi(t)$;
 $X_{\pi(t)}(t) \sim \{-1,1\}$, for $t = 1, 2, \dots, n$

$$X(0) = 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \dots$$

$$X(1) = 0 \ 0 \ 0 \ 0 \ 0 \ | \ 0 \ 0 \dots$$

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

$$f = 1 + x_1 + x_2 + x_1 x_2$$

Uniform process

1. Random permutation π ,
2. $X(0) = 0^n$,
3. $X_i(t) = X_i(t - 1)$, for $i \neq \pi(t)$;
 $X_{\pi(t)}(t) \sim \{-1,1\}$, for $t = 1, 2, \dots, n$

$$X(0) = 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \dots$$

$$X(1) = 0 \ 0 \ 0 \ 0 \ 0 \mid 0 \ 0 \dots$$

$$X(2) = 0 \ 0 \ -1 \ 0 \ 0 \mid 0 \ 0 \dots$$

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

Uniform process

1. Random permutation π ,
2. $X(0) = 0^n$,
3. $X_i(t) = X_i(t-1)$, for $i \neq \pi(t)$;
 $X_{\pi(t)}(t) \sim \{-1,1\}$, for $t = 1, 2, \dots, n$

Observation.

- i. $X(t)$ induces a random restriction $f|_{R(t)}$,
- ii. $X(n)$ is a uniformly random element from $\{-1,1\}^n$,
- iii. $f(X(t)) = \mathbf{E}_{z \in \{-1,1\}^{n-t}}[f|_{R(t)}(z)]$ is a martingale.

Two random processes

$f: \{-1,1\}^n \rightarrow \{0,1\}$ (by multilinear extension $f: \mathbb{R}^n \rightarrow \mathbb{R}$)

Uniform process

1. Random permutation π ,
2. $X(0) = 0^n$,
3. $X_i(t) = X_i(t-1)$, for $i \neq \pi(t)$;
 $X_{\pi(t)}(t) \sim \{-1,1\}$, for $t = 1, 2, \dots, n$

Observation.

- i. $X(t)$ induces a random restriction $f|_{R(t)}$,
- ii. $X(n)$ is a uniformly random element from $\{-1,1\}^n$,
- iii. $f(X(t)) = \mathbf{E}_{z \in \{-1,1\}^{n-t}}[f|_{R(t)}(z)]$ is a martingale.

e.g. $f = 1 + x_1 + x_2 + x_1 x_2$,
 $f(0) = \mathbf{E}_{x \in \{-1,1\}^n}[f(x)]$

Two random processes

Conditioned process

1. Random permutation π ,
2. $Y(0) = 0^n$,
3. for $t = 1, 2, \dots, n$, let $Y_i(t) = Y_i(t - 1)$,

$$\Pr\{Y_{\pi(t)}(t) = \pm 1\} = \frac{1}{2} \pm \frac{\partial_{\pi(t)} f(Y(t - 1))}{2f(Y(t - 1))}.$$

Two random processes

Conditioned process

1. Random permutation π ,
2. $Y(0) = 0^n$,
3. for $t = 1, 2, \dots, n$, let $Y_i(t) = Y_i(t - 1)$,

$$\Pr\{Y_{\pi(t)}(t) = \pm 1\} = \frac{1}{2} \pm \frac{\partial_{\pi(t)} f(Y(t - 1))}{2f(Y(t - 1))}.$$

Fact. $Y(n)$ is a uniformly random element from $f^{-1}(1)$

Two random processes

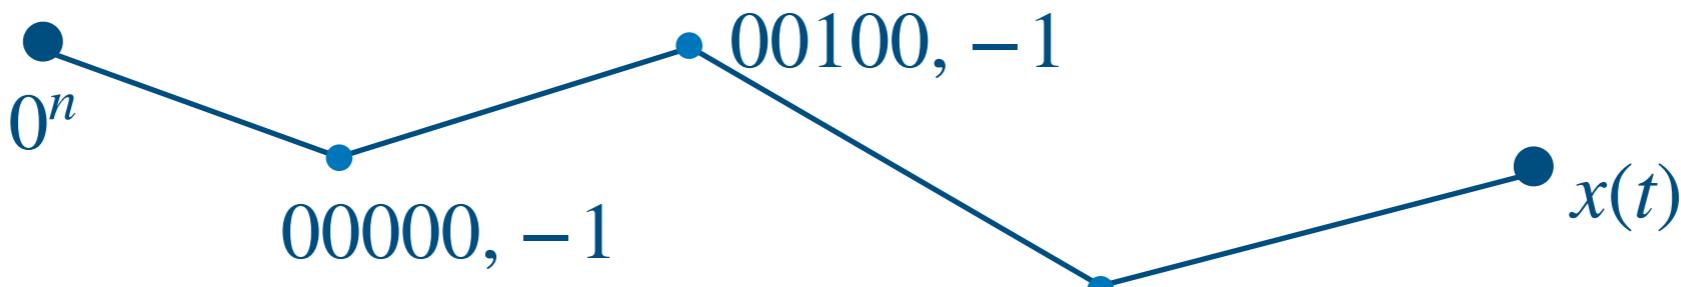

Conditioned process

1. Random permutation π ,
2. $Y(0) = 0^n$,
3. for $t = 1, 2, \dots, n$, let $Y_i(t) = Y_i(t - 1)$,

$$\Pr\{Y_{\pi(t)}(t) = \pm 1\} = \frac{1}{2} \pm \frac{\partial_{\pi(t)} f(Y(t - 1))}{2f(Y(t - 1))}.$$

Fact. Fix some path $x(0), x(1), \dots, x(t) \in \{-1, 0, 1\}^n$,

$$\frac{\Pr[\forall i \in [t], Y(t) = x(t)]}{\Pr[\forall i \in [t], X(t) = x(t)]} = \frac{f(x(t))}{f(0)}.$$

Two random processes

Conditioned process

1. Random permutation π ,
2. $Y(0) = 0^n$,
3. for $t = 1, 2, \dots, n$, let $Y_i(t) = Y_i(t-1)$,

$$\Pr\{Y_{\pi(t)}(t) = \pm 1\} = \frac{1}{2} \pm \frac{\partial_{\pi(t)} f(Y(t-1))}{2f(Y(t-1))}.$$

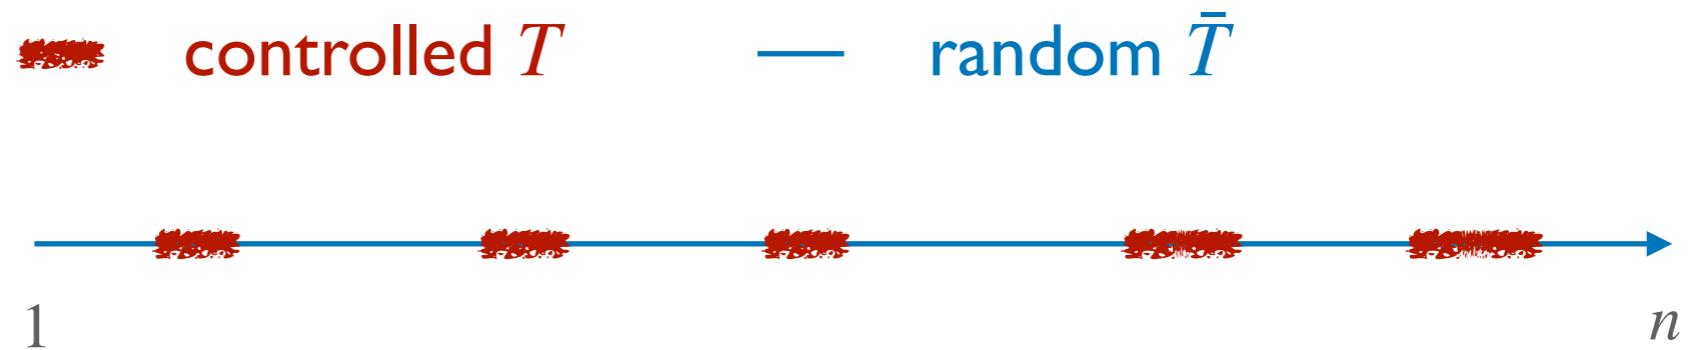

Fact. Fix some path $x(0), x(1), \dots, x(t) \in \{-1, 0, 1\}^n$,

$$\frac{\Pr[\forall i \in [t], Y(t) = x(t)]}{\Pr[\forall i \in [t], X(t) = x(t)]} = \frac{f(x(t))}{f(0)}.$$

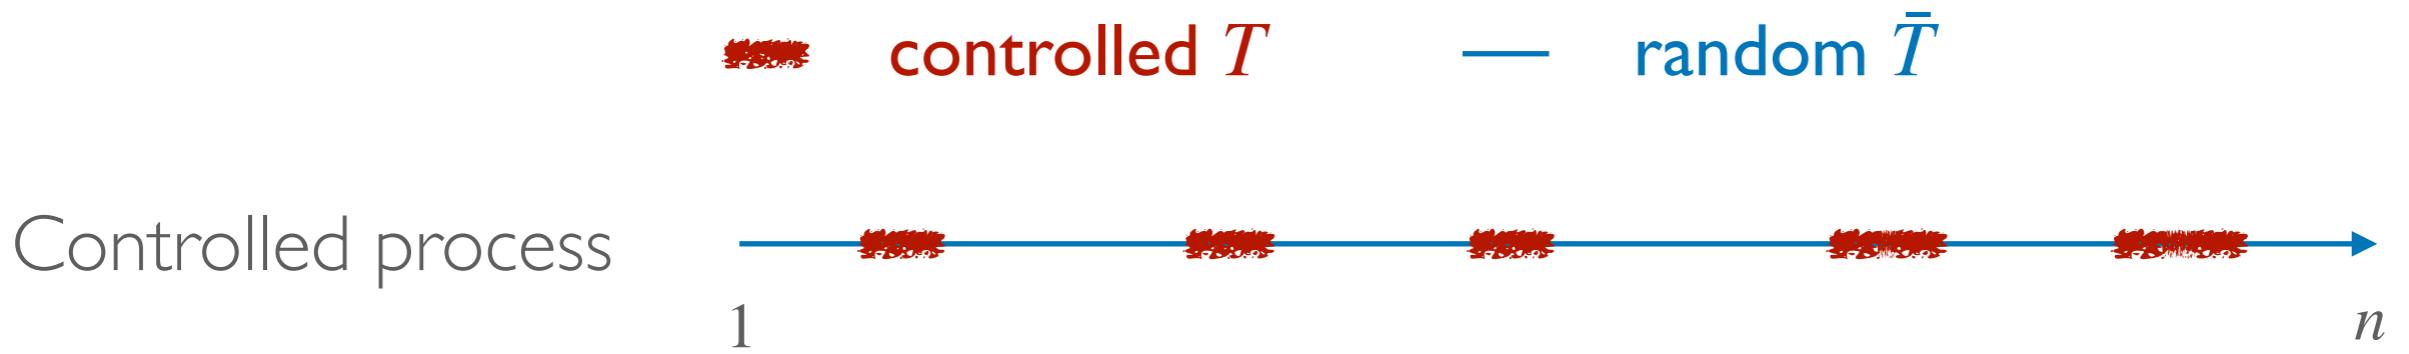

Pf. $\text{lhs} = \prod_{i=1}^t 2 \frac{f(x(i-1) + x_{\pi(i)} e_{\pi(i)})}{2f(x(i-1))} = \frac{f(x(t))}{f(0)}.$

Controlled Process

Controlled process

Controlled Process

THE GAME: expose the variables in a random order:
(w.p. $1 - \epsilon$) expose the variable uniformly randomly;
(w.p. ϵ) player gets to decide.

Controlled Process

THE GAME: expose the variables in a random order:
(w.p. $1 - \epsilon$) expose the variable uniformly randomly;
(w.p. ϵ) player gets to decide.

THE GOAL: sample $x \in f^{-1}(1)$ uniformly at random.

Controlled Process

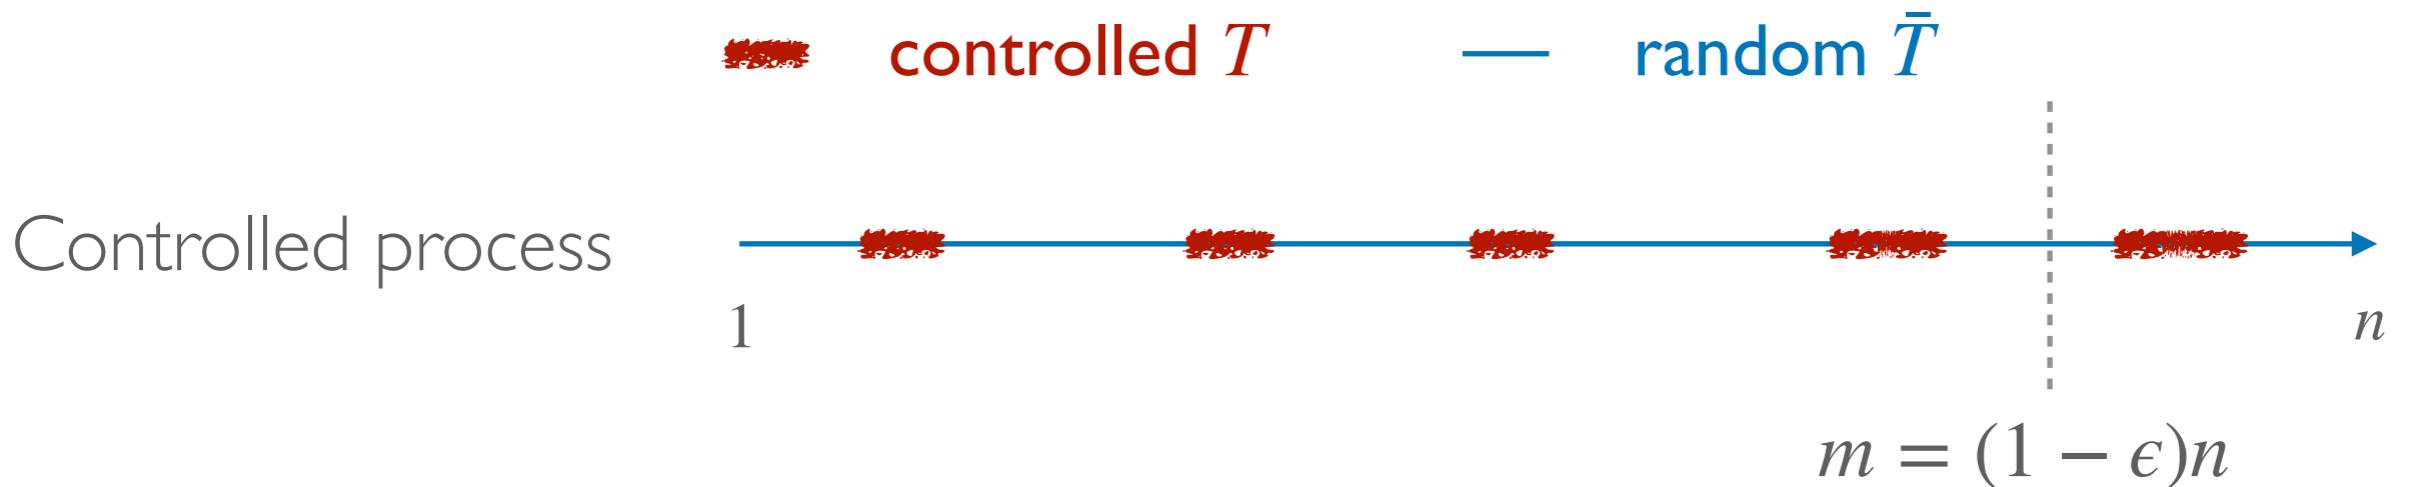

THE GAME: expose the variables in a random order:
(w.p. $1 - \epsilon$) expose the variable uniformly randomly;
(w.p. ϵ) player gets to decide.

THE GOAL: sample $x \in f^{-1}(1)$ uniformly at random.

Mission impossible!
